

Chain filter

Extremely quiet extraction system
with maximum capacity

The PGKF filter system has been developed for larger agricultural companies for the extraction of dust and skins.

This unit consists of several extremely quiet extraction fans and a large number of filters which are cleaned automatically using compressed air. The suction power therefore remains consistent and optimal. The capacity is variable and automatically adjustable. The extracted air returns clean into the processing room. This way, no heat is lost and energy is saved.

Overview

Type	kW	extraction points (indication)
PGKF 522, 3 fans	7,5	15-20
PGKF 1045 6 fans	7,5	30-40

Waste solutions

For dust, skins and other dirt

The waste, coming from the extraction system is discharged by a rotating valve and can be collected in many different ways.

Jongejans offers several waste collection systems:

- Boxes
- Tilt containers
- (Press) containers
- Self-unloading cars
- Tipping trailers
- Special bunkers
