

Agra Cyclojet

Dust and skin extraction

The cyclo-jet is a filter system that separates extracted agricultural dust and skins from the air.

Thanks to the built-in (compressed air cleaned) filter cartridges, the extracted air is returned clean to the processing room. This way, no heat is lost and saves energy.

Dust and skins come from the cyclojet and fall into a waste box or can be unloaded onto a conveyor belt. The filters are cleaned automatically. This guarantees optimum extraction capacity at all times.

Overview

Type	kW	extraction points (indication)
Cyclojet 400	11	4-6
Cyclojet 500	18,5-22	8-10

Good extraction ensures better operation of machines, less dust in the room and for cleaner products without skins.
